NEWLY DEVELOPED
THORAX SHAPE
DOUBLE INSULATION

Lifesaving thermal protection for hypothermal patients

Thorax Thermal Blanket™

Easy and efficient: Thorax shape with double insulation

Double layered, tight fitting and insulating thermal blanket - developed by Danish ambulance men

The special shape is developed for optimal protection of thorax and head for maximum heat retention. The silver foil facing the patient retains the body temperature while the multi-layer blanket prevents heat loss.

FACTS:

"Hypothermia is dangerous. It is often witnessed in near drowning incidents and with trauma patients ashore. Protection of head and thorax is extremely important. Heat loss from the head alone is about 50%. For multi trauma patients the survival rate drops to 50% if the body temperature is below 34 degrees. With a body temperature below 32 degrees survival is very rare."

*Benedict Kjærgaard, Air Force Doctor, Chief Physician
Thorax surgery, Aalborg Hospital*

- **Developed by ambulance men**
- **Improved durability**
- **Tight fitting thorax shape**
- **Easy access to fit electrodes**
- **Double insulation**
- **Protection of thorax and head**
- **3 sizes: S/M/L**
